TROJAN *Coating*

ProSpray

Our range of cold wax coatings are used to rejuvenate the wet percentage of the coating in an existing waxed surface, or to provide a dust free environment to a dry sand based surface.

By replenish this wet aspect of the wax coating it is possible to prolong the life of your surface by up to 50% of the manufacturer's expectations.

For a non-waxed surface the coatings can prevent dust and keep the sand and fibre together even in the driest of conditions to drastically improve the footing of a surface.

We have extensively researched our range of Competitor's waxed products to produce maintenance coatings that are precisely blended to counteract the ageing issues of each surface.

We have recently re-waxed Wolverhampton Racecourse's track which has made a great improvement to the riding condition

Our wax coatings provide a dust-free footing and significantly reduce the chances of a surface drying out in the summer and freezing in the winter
